

Airbrakes — Deploy Decision Tree

Evaluated every 50 ms loop tick. Any FAIL forces $cd_add = 0$ (retracted).

State-machine prerequisite

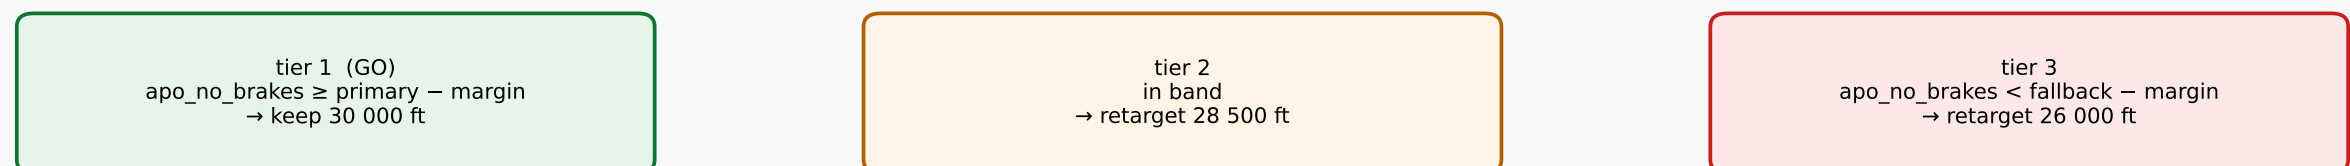

AirbrakeController::update() gates

Fallback target ladder — one-shot at 20 k AGL (evaluateFallbackTarget, main.cpp:966)

Once $alt \geq FALLBACK_ARM_ALT_AGL_M$ and controller is CTRL_ACTIVE, live apo_no_brakes is checked once with ± 200 m margin:

gate / check

deploy outcome

retracted ($cd_add = 0$)

state-pass / PASS edge
